SUMMARY

Software Engineer with 5 years of experience designing and building scalable software systems at Amazon and Microsoft. Delivered revenue driving advertising solutions for Amazon MiniTV and currently developing growth and engagement experiences for Microsoft Copilot. Strong background in distributed systems, backend development, and solving complex engineering challenges at scale.

WORK EXPERIENCE

Microsoft Copilot, Hyderabad

Aug 2025 - Present

- Part of the Microsoft Copilot Growth team, building experiences that drive user acquisition, activation, and retention for Microsoft Copilot.
- Designed and developed a Deferred Deeplink platform using device fingerprinting to preserve campaign context across app installs, enabling personalized onboarding experiences and improving marketing attribution.
- Led the migration of Microsoft 365 Copilot free users to the standalone Copilot app to deliver a seamless user transition resulting in +38K GSA gain on Android and ~28% higher purchase on iOS.
- Built a cross-application context transfer system that preserves file context when users install and launch Microsoft 365 apps (Word, Excel, PowerPoint) from Copilot, enabling seamless continuation of document workflows across applications.

Aug 2021 - Mar 2025

Amazon MXPlayer, Bangalore

- Launched static image ads on miniTV, introducing a new ad format that created a dedicated revenue stream now contributing 25–30% of total ad revenue; automated ad ingestion with dynamic slot management reduced maintenance overhead by 20%.
- Redesigned the ad break experience to show multiple ads within a single break instead of one, reducing total ad interruptions for viewers while boosting video completion rates from 90% to 94% and achieving a 99% completion rate on the second ad, cutting Time To First Frame by 50ms via a backend-driven architecture.
- Built a system that identifies products appearing in videos and surfaces relevant Amazon shopping ads in real time, so viewers can discover and buy what they see. Used AWS SageMaker and OpenSearch (KNN) to reduce product identification time from 10 minutes to 1 minute (10× faster) with 60% better accuracy across 10–12 million images.

EDUCATION

Ujjain Engineering College, Ujjain

July 2017 - July 2021

Bachelor of Technology in Computer Science

ADDITIONAL INFORMATION

- **Languages:** Java, Python, C, C++, C#, JavaScript, TypeScript
- **Frameworks:** React, Spring Boot, Dagger, Android SDK, Node.js
- **Cloud & Infra:** AWS (Lambda, DynamoDB, S3, CDK, CloudWatch, Sagemaker, Glue, EC2), Azure
- **Tools & Technologies:** Git, MySQL, MongoDB, REST APIs, Microservices, Monolithic Architectures
- **Specializations:** Backend Development, Frontend Development, System Design, Data Structures & Algorithm, Problem Solving, Competitive Programming, HLD, LLD, Operational Excellence
